Appendices

Appendix A

We have referred to official standards and regulations regarding the transmission of safety information for civil aviation engineering projects, as shown in Table A1. The right column (Information Sender) represents the originating party; the left column (Information Receiver) represents the corresponding recipient. Status = 1 indicates an active safety information exchange relationship between the two subjects. CAAC = Civil Aviation Administration of China. Art(s). = Article(s). § = Section. Where a single issuing authority published multiple documents in the same year, suffixes a, b, c are appended in chronological or alphabetical order.

Note: We identify safety information actors and their information flow relationships from safety standards and related documents on construction during airport operations in civil aviation. The URL of the reference regulations and standards is: *https://mp.weixin.qq.com/mp/homepage?__biz=MzU2NDM3NTM0Mg==&hid=3&sn=aa02e71049de58793b1e05c38931d75a&scene=18#wechat_redirect*. The full list of documents is provided in Appendix B.

Table A1 Safety Information Exchange Among Information Subjects in Civil Aviation Engineering Construction

Information Receiver	**Status**	**Regulatory Basis**
Information Receiver	**Status**	**Information Sender: Civil Aviation Management Organization**
Exploration unit	1	CAAC (2022b), Arts. 83, 88, 89

Appendix C

As described in the main text, we use the IDEF0 method to characterize how safety information flows through the key activities and processes of construction during airport operations, with the main functional modules derived from the relevant safety standards. The modeling process is illustrated through the following four figures.

Fig. C1 presents the top-level structure of the IDEF0 model, which depicts the overall functional modules of the safety information chain in construction during airport operations. The arrows in the model represent the flow of safety information governed by the relevant regulations and operational processes of construction during airport operations. The same conventions apply to Figs. C2-C4. In all four models, policies, laws and regulations, standard specifications, and the safety management system serve as the control components, denoted by "↓". The mechanism guarantees of the safety information chain are provided by the stakeholders involved in construction and the corresponding safety inputs, denoted by "↑". Building on the control and mechanism components defined at the top level, the functional modules of the safety information transmission chain are decomposed into three modules: application and approval, implementation, and acceptance.

The refined results across these three modules enable a more granular examination of safety information flow within each functional module. First, the application and approval module is decomposed into two sub-modules: A (application) and B (approval). The application sub-module relies primarily on the safety responsibility letter and organizational management; through the safety management system, relevant standards, and applicable laws and regulations, it produces the outcome of the construction application. The approval sub-module takes construction safety requirements and other safety assurance information as inputs, generating outputs that include the NOTAM (Notice to Airmen), assigned safety management personnel, safety supervision

and inspection records, and safety self-examination reports, as shown in Fig. C2.

Fig. C3 illustrates the refinement of the implementation module, which is decomposed into three sub-modules: C (construction commencement), D (construction area control), and E (construction safety requirements). The inputs of this module include the original NOTAM information, the allocation of safety management personnel, safety supervision and inspection records, safety self-examination reports, and other related information. Beyond the controls imposed by laws and regulations, standards, and management systems, this module is further constrained by safety inputs and the activities of participating parties. The outputs include the special acceptance report on safety and environmental protection, quality qualification documents, and the flight inspection report.

Fig. C4 decomposes the acceptance module into two sub-modules: F (pre-acceptance) and G (completion acceptance). Under the same control conditions (laws and regulations, standards, and management systems) and mechanism conditions (safety inputs and the activities of participating parties), the inputs to this module include quality qualification documents, survey evaluations, and design inspections. The outputs include the special acceptance report on safety and environmental protection and the flight inspection report.
